INTRODUCTION

Programs of varying complexity and from different fields have been included in this library to provide a sample of the usefulness and versatility of the 2200 series calculators. Programs have been selected bearing in mind their use and possible application. Each one contains a set of instructions which is easy to follow; at least one example per program has been given to facilitate checking and enhance comprehension.

In loading the program tapes advantage may be taken of SKIP and BACKSPACE features. These two features and their use are explained on a following page.

Programs are designed to display all output on the CRT. However, they may be adapted for printing the output on either the 2201 (typewriter) or the 2221 (Hi-Speed Printer).

Note: All operating instructions assume you are at the beginning of the block you desire.

If you wish to load programs that are separated by other blocks, you may use one of two methods.

- (1) LOAD each block until you reach the desired block. This would require the repetition of 4 keystrokes for each block between your current position and your desired position. The 4 keystrokes would be:

CLEAR , CR/LF , LOAD , CR/LF

This method would require you to REWIND the tape if you desire a block which you have passed.

- (2) Using the SKIP feature will allow you to go from one block to another with less work, and the BACKSPACE feature will allow you to "back-up" to a block that you have passed.
- a) SKIP - Subtract from the Block # corresponding to where you wish to be, the Block # corresponding to your current location then subtract 1. This is the # of files to skip to place you at the beginning of the desired block.

For Example,

The last block loaded was 4; you wish to load block 12.

$$12 - 4 - 1 = 7$$

Key S, K, I, P, 7, F, CR/LF

- b) BACKSPACE - Subtract from the block # corresponding to your present location, the block # corresponding to your desired location then add 1. This is the # of files to backspace to place you at the beginning of the desired block.

For Example,

The last block loaded was 12; you wish to load block 4,

$$12 - 4 + 1 = 9$$

Key B, A, C, K, S, P, A, C, E, 9, F, CR/LF

To change output device from 2216 (CRT display) to 2201 (typewriter) or 2221 (Hi-Speed Printer) the following procedure is used:

1. Choose what output is to be displayed or typed.
2. Insert a statement with the following information:
For CRT display
Statement # SELECT PRINT 005
For Typewriter (2201)
Statement # SELECT PRINT 211
For Hi-Speed Printer (2221)
Statement # SELECT PRINT 215

It may be advisable to change print to the CRT at the end of the program.

PROGRAM ABSTRACT

Calculates the dollar price of a bond whose maturity is \geq 6 months.

BLOCK	SAVE "NAME"	BYTES REQUIRED
2		1278

PROGRAM DESCRIPTION

This program calculates a dollar price for a bond whose maturity is ≥ 6 months.

The program requests an increment value, the inputted yield is decreased by a value 5 times the increment value and the dollar price for 11 yields, ranging from (yield - 5* increment) to (yield + 5*increment) in increments of the increment value, is calculated.

I. Dollar Price (for maturities between 6 months and 40 yrs., 3 mos.)

$$\text{price} = \frac{C(T-1)}{2} + \frac{R + \frac{100C}{Y} \left[\left(\frac{Y}{200} + 1 \right)^{N+1} - 1 \right]}{\left(\frac{Y}{200} + 1 \right)^{N+T}}$$

where C = Coupon

Y = Yield

R = redemption value (100 unless otherwise stated, ((Call Price)))

N = number of whole semi-annual periods.

T = fractional number of semi-annual periods (omitting odd days)

The dollar price is calculated at the two months bracketing the time to maturity; then the interpolation for the odd number of days is applied.

EXAMPLE:

Settlement Date: $5/3/70 = 5(30) + 3 + 70(360) = 25353$

Maturity Date: $2/21/89 = 2(30) + 21 + 89(360) = 32121$

D_{SM} : Number of days between settlement date and maturity date = 6768

$\frac{6768}{30} = 225.6$ (months) (fractional portion of a month used for interpolation)

$\frac{225}{6} = 37.5$ (semi-annual periods)

where N = 37 (whole semi-annual periods)

and T = .5 (fractional number of semi-annual periods)

PROGRAM DESCRIPTION (Cont)

To find dollar price:

1. Solve equation where $N + T = 37.5$
2. Solve equation where $N + T = 37.66666666$
(add 1 month $\left(\frac{1}{6}\right)$ to 37.5)
3. Interpolate for the .6 month remaining - round off the answer three places after decimal point.

when $N + T = 37.5$ the dollar price is 81.973(A)

$N + T = 37.66666666$ the dollar price is 81.933 (B)

then $B - A = -.04$; $(.6)(-.04) = -.024$

Dollar Price = $A + (-.024) = 81.949$

NOTE: If $C = Y$ (coupon = yield), then the dollar price for all non-callable bonds is stated as 100 (par).

II. Dollar Price for Long-Term Bonds

This is calculated in the same manner as a dollar price for bonds with maturities between 6 months and 40 years 3 months except that the interpolation is between semi-annual periods (instead of months). Instead of adding $1/6$ to $N+T$ before solving the equation a second time, add 1 to $N+T$.

EXAMPLE

Settlement Date: $5/3/70 = 5(30) + 3 + 70(360) = 25353$

Maturity Date: $2/28/11 = 2(30) + 28 + 11(360) = 4048$

$D_{SM} =$ Number of days between settlement date and maturity date = $4048 - 25353$
 $= -21305$ (since this is a negative value, add 36000 . . . 14695 days)

$\frac{14695}{180} = 81.6388888888$ (semi-annual periods)

where $N + T = 81$

PROGRAM DESCRIPTION (Cont)

To find dollar price:

1. Solve equation where $N + T = 81$
2. Solve equation where $N + T = 82$
(add 1 semi-annual period to 81)
3. Interpolate for the odd days remaining (.6388888888) - round off the answer three places after the decimal point.

when $n + t = 81$ the dollar price is 101.725 (A)

$n + t = 82$ the dollar price is 101.730 (B)

then $B - A = .005; (.6388888888) (.005) = .003194444444$

Dollar Price = $A + (.003194444444) = 101.728$

NOTE

Many operating instructions are presented via the CRT (display) or one of the output devices. When such instructions occur the word INSTRUCTION will appear on the left hand side of the operating instructions and what is displayed or typed will appear on the right hand side.

PROGRAM ABSTRACT

Calculates the basis of a bond whose maturity \geq 6 months.

BLOCK	SAVE "NAME"	BYTES REQUIRED
3		1818

PROGRAM DESCRIPTION

Calculates the yield (basis) of a bond whose maturity ≥ 6 months.

The program requests an increment value, the inputted \$ Price being decreased by a value 5 times the increment value and the yield for 11 dollar prices, ranging from (\$ price - 5 * increment) to (\$ price + 5 * increment) in increments of the increment value, is calculated.

The yield is calculated by the Newton-Rhapson Method:

$$B = A - \frac{F(x)}{F'(x)}$$

where $F(x) = \$ \text{ price formula} - \text{Price}$

$F'(x) = \text{1st derivative of } \$ \text{ price formula} - \text{Price}$

For information on interpolation see Bond Dollar Price Program.

NOTE

Many operating instructions are presented via the CRT (display) or one of the output devices. When such instructions occur the word INSTRUCTION will appear on the left hand side of the operating instructions and what is displayed or typed will appear on the right hand side.

OPERATING INSTRUCTIONS

EXAMPLE

Find the yield for the following data:

PROGRAM ABSTRACT

Calculates the accumulated amount of an annuity.

BLOCK	SAVE "NAME"	BYTES REQUIRED
9		308

PROGRAM DESCRIPTION

Calculates the accumulated amount of an annuity by:

$$\text{Amount} = R * S_{\overline{n}|i}$$

where:

R = amount of each payment

$$S_{\overline{n}|i} = \frac{(1+i)^n - 1}{i}$$

i = interest rate/period

n = term of annuity (time from beginning of 1st payment to the end of the last)

PROGRAM ABSTRACT

Computes the "average" growth rate in sales, earnings, etc. of a company over N years.

BLOCK	SAVE "NAME"	BYTES REQUIRED
22		1101

PROGRAM DESCRIPTION

Computes the "average" growth rate in sales, earnings, etc. of a company over N years. Given the total sales S_0, S_1, \dots, S_n of a company for each year over a period of N years, we perform a linear regression to determine the "average" growth rate, G. Using G we can project what the sales of the company should be in the mth year by:

$$S_n = S_0 (1 + G)^m$$

NOTE

Many operating instructions are presented via the CRT (display) or one of the output devices. When such instructions occur the word INSTRUCTION will appear on the left hand side of the operating instructions and what is displayed or typed will appear on the right hand side.

OPERATING INSTRUCTIONS

EXAMPLE

For the above data, compute the average growth rate, and projected sales for years 1968, 1970 and 1972.

1. Key
2. Key
3. INSTRUCTION
4. Key FIRST YEAR
5. INSTRUCTION
6. Key LAST YEAR
7. INSTRUCTION
8. Key 1st YEAR'S SALES

FIRST YEAR FOR WHICH FIGURES ARE KNOWN?

4. Key 1 9 6 0

LAST YEAR FOR WHICH FIGURES ARE KNOWN?

6. Key 1 9 6 6

SALES FOR PERIOD (YEAR)

8. Key 1 0

The program will ask for all sales figures in the same manner as Step 7, 8. After all figures have been entered, go to Step 9.

OPERATING INSTRUCTIONS (Cont)

9. Read

'AVE.' GROWTH RATE = 16.5200896494
PERCENT

10. INSTRUCTION

YEAR OF INTEREST (FOR PROJECTED
SALES)

11. Key YEAR

11. Key 1 9 6 8

12. Read

PROJECTED SALES FOR YEAR 1968
= 35.10952

If you wish to calculate more projected sales, go to Step 10. Otherwise,
Key 0 .

PROGRAM ABSTRACT

Plots a function of X, $f(x)$ on a set of coordinate axes.

BLOCK	SAVE "NAME"	BYTES REQUIRED
23		1061

PROGRAM DESCRIPTION

Plots a function of X, $f(x)$, on a set of coordinate axes. The user must supply the following information:

1. Function to be plotted.
2. Lower limit of X (X_1).
3. Upper limit of X (X_2).
4. Increment by which X is to be increased between each plotted point.
5. Lower limit of Y (Y_1).
6. Upper limit of Y (Y_2).
7. Increment by which Y is to be increased.

The X-axis runs vertically. If $Y = 0$ is in the specified range of Y and is actually attained when incrementing from Y_1 to Y_2 , then the true X-axis is printed. Otherwise, the X-axis is the line $Y = Y_1$. The Y-axis runs horizontally. The true Y-axis is printed if $X = 0$ is in the range of X and is actually attained. Otherwise, the Y-axis is the line $X = X_1$.

For typewriter output, insert the following two statements in program:

```
47 SELECT PRINT 211
900 SELECT PRINT 005
```

NOTE

Many operating instructions are presented via the CRT (display) or one of the output devices. When such instructions occur the word INSTRUCTION will appear on the left hand side of the operating instructions and what is displayed or typed will appear on the right hand side.

OPERATING INSTRUCTIONS

EXAMPLE

Plot $Y = \sin(2X)$

1. Key RESET CLEAR CR/LF
LOAD CR/LF

Enter the function in line 1 of the program as follows:

1 DEF FNC(X) = function of X.

For example, the function $f(x) = X^2 \cos(X)$ would be entered as follows:

1 DEF FNC(X) = X 2*cos(X)

2. Key 1 DEFFN C (X) = f(x)
CR/LF

2. Key 1 DEFFN C (X) =
SIN(2 * X) CR/LF

3. Key RUN CR/LF

4. INSTRUCTION

PROGRAM ABSTRACT

Plots from 1 to 9 functions of X on the same set of coordinate axes.

BLOCK	SAVE "NAME"	BYTES REQUIRED
24		1392

PROGRAM DESCRIPTION

Plots from 1 to 9 functions of X on the same set of coordinate axes. The user must supply the following information:

1. Number of functions being plotted.
2. Each function to be plotted.
3. Lower limit of X(X_1).
4. Upper limit of X(X_2).
5. Increment by which X is to be increased between each plotted point.
6. Lower limit of Y(Y_1).
7. Upper limit of Y(Y_2).
8. Increment by which Y is to be increased.

The X-axis will run vertically and be the line $Y = Y_1$. The Y-axis will run horizontally and be the line $X = X_1$; the number of steps in the Y-axis must be ≤ 70 .

The first function will be represented by the character "1", the second by "2", etc. If more than 1 function is to be plotted at the same location, an asterisk is printed. Values of the function outside the specified range of Y are ignored.

For typewriter output, insert the following two statements in the program:

```
205 SELECT PRINT 211
555 SELECT PRINT 005
```

NOTE

Many operating instructions are presented via the CRT (display) or one of the output devices. When such instructions occur the word INSTRUCTION will appear on the left hand side of the operating instructions and what is displayed or typed will appear on the right hand side.

OPERATING INSTRUCTIONS

EXAMPLE

PROGRAM ABSTRACT

Plots a function $f(\theta)$ in polar coordinates.

BLOCK	SAVE "NAME"	BYTES REQUIRED
25		2636

© Wang Laboratories, Inc., 1973

Printed in U.S.A.

PROGRAM DESCRIPTION

Plots a function $f(\theta)$ in polar coordinates. The X-axis (0 = zero degrees) runs horizontally; the Y-axis runs vertically. Each axis is 6 inches long. The user must specify the value of the positive end of the X-axis.

For typewriter output, insert the following two statements in the program:

```
2 SELECT PRINT 211
205 SELECT PRINT 005
```

NOTE

Many operating instructions are presented via the CRT (display) or one of the output devices. When such instructions occur the word INSTRUCTION will appear on the left hand side of the operating instructions and what is displayed or typed will appear on the right hand side.

OPERATING INSTRUCTIONS

EXAMPLE

Plot $f(x) = 2 * (1 - 2 * \sin((X)))$

max. value of positive X-axis is 7.

- 1. Key RESET CLEAR CR/LF
LOAD CR/LF

Enter the function, $f(\theta)$, in line 5 of the program as follows:

5 DEF FNC(T) = "function"

For example, the function $f(\theta) = 4 \sin (2\theta)$ would be entered as follows:

5 DEF FNC(T) = 4 * sin (2 * T)

NOTE: The letter T replaces θ .

- 2. Key 5 DEFN C (T) = f(T)

- 2. Key 5 DEFN C (T) = 2 *
(1 - 2 * sin(T)) CR/LF

- 3. Key RUN CR/LF

PROGRAM ABSTRACT

Plots a set of (X, Y) data points on a set of coordinate axes.

BLOCK	SAVE "NAME"	BYTES REQUIRED
26		3188

PROGRAM DESCRIPTION

Plots a set of (X, Y) data points on a set of coordinate axes. The user must supply the following information:

X1 - the lower X-endpoint

X2 - the upper X-endpoint

ΔX - the X-increment

Y1 - the lower Y-endpoint

Y2 - the upper Y-endpoint

ΔY - the Y-increment

N - the number of data points to be plotted

$(X_1, Y_1), \dots, (X_N, Y_N)$ - the data points

The X-axis runs vertically. The Y-axis runs horizontally and may have no more than 60 steps in it.

For typewriter output, insert the following two statements in program.

```
125 SELECT PRINT 211: (150) Print Hex (OE)  
465 SELECT PRINT 005(64)
```

NOTE

PROGRAM ABSTRACT

Program contains 6 subroutines for the user.

BLOCK	SAVE "NAME"	BYTES REQUIRED
28		1467

PROGRAM DESCRIPTION

This program is made up of 6 subroutines to do:

- Sort numeric arrays
- Sort alpha-numeric arrays
- Pack numeric arrays
- Unpack numeric arrays

These subroutines must be used as a part of a main program written by the user. All numeric arrays are X() and the alpha array is A\$(), N is the number of items in the array, and C is a value 1 or 0 denoting Hi to Lo or Lo to Hi.

There are two sets of pack and unpack subroutines. The first set will handle positive integers of 6 digits. The second set uses the natural log and exponentiation. Accuracy is lost when you use the last set.

To use these subroutines, the user must "call" them by using the GOSUB' verb.

PROGRAM ABSTRACT

Game to determine your rank in the army artillery.

BLOCK	SAVE "NAME"	BYTES REQUIRED
29		1653

© Wang Laboratories, Inc., 1973

Printed in U.S.A.

PROGRAM DESCRIPTION

Pretend you are in the artillery branch of the army and are about to take a test to determine your rank. This rank will be based on how many times you must fire your gun to zero in on and destroy a one foot target which has been placed at any distance in miles that you specify. You will be asked to enter the following information:

D = distance in miles that you want the target placed

A = angle in degrees of your gun barrel

V = velocity in ft/sec. of the projectile

NOTE

Many operating instructions are presented via the CRT (display) or one of the output devices. When such instructions occur the word INSTRUCTION will appear on the left hand side of the operating instructions and what is displayed or typed will appear on the right hand side.

PROGRAM ABSTRACT		
This program calculates the mass of nitrogen in the reactor containment system on a periodic basis to provide a measure of the leakage rate.		
BLOCK	SAVE "NAME"	BYTES REQUIRED
34		616

PROGRAM DESCRIPTION

This program (adapted from a program written by W. Wold, District Manager, San Rafael) calculates the mass of nitrogen (used as an inert fill gas) in the reactor containment system on a periodic basis to provide a measure of the leakage rate. There are 4 drybulb temp. sensors, 2 dewpoint sensors, a manometer for gauge pressure, and a barometer for atmospheric pressure. Mass of nitrogen is calculated by the perfect gas law.

P_1	= Barometric Pressure (In. Hg)
P_2	= Containment Pressure (In. Water)
T_1, T_2	= Dewpt. Sensors (Deg. F)
S_1, S_2, S_3, S_4	= Drybulb Sensors (Deg. F)
M	= Mass of Nitrogen (Lb)
PW	= Partial pressure of water vapor in containment based on TA
TA	= Average dewpoint
PN	= Partial pressure of N in containment
SA	= Average Abs. drybulb temperature
PT	= Containment pressure (PSIA)
PT	= $.49116 * P_1 + .036127 * P_2$
PN	= $PT - PW$
SA	= $459.6 + (S_1 + S_2 + S_3 + S_4) / 4$
M	= $32637 * PN / SA$

NOTE

Many operating instructions are presented via the CRT (display) or one of the output devices. When such instructions occur the word INSTRUCTION will appear on the left hand side of the operating instructions and what is displayed or typed will appear on the right hand side.

OPERATING INSTRUCTIONS

EXAMPLE

Find the mass of Nitrogen given:

Barometric pressure (In. Hg) = 29.87

Containment pressure (In. H₂O) = 24.19

Dewpoint (Deg F)

Sensor T1 = 85.2

Sensor T2 = 89.3

Drybulb Sensors (Deg F)

Sensor S1 = 139

Sensor S2 = 85

Sensor S3 = 124.5

Sensor S4 = 89.5

Partial pressure of water vapor based on dewpoint of 87.25°F = .64.

PROGRAM ABSTRACT

Computes the concentration of unknowns given the percent absorption read from an atomic absorption spectrophotometer.

BLOCK	SAVE "NAME"	BYTES REQUIRED
35		502

PROGRAM DESCRIPTION

Computes the concentration of unknowns given the percent absorption read from an atomic absorption spectrophotometer. Two known samples (standards) are to use only one standard, the second standard may arbitrarily be assigned coordinates of 0 concentration, 0 percent absorption.

NOTE: adapted from a program written by E. R. McGough, Kermac Potash Co.

$$C = (C_2 - C_1) \left(\frac{\text{LOG} \frac{(100 - A_1)}{(100 - A)}}{\text{LOG} \frac{(100 - A_1)}{(100 - A_2)}} \right) + C_1$$

where:

C = concentration (unknown)

C₁ = concentration (low standard)

C₂ = concentration (high standard)

A₁ = percentage (low standard)

A₂ = percentage (high standard)

A = percentage (unknown)

NOTE

Many operating instructions are presented via the CRT (display) or one of the output devices. When such instructions occur the word INSTRUCTION will appear on the left hand side of the operating instructions and what is displayed or typed will appear on the right hand side.

OPERATING INSTRUCTIONS

EXAMPLE

Determine the concentration, given the following data:

	LOW STD.	HIGH STD.
CONCENTRATION	4.46	8
PERCENTAGE	40	60

Percentage (unknown) = 6.051797415

1. Key RESET CLEAR CR/LF
LOAD CR/LF
 2. Key RUN CR/LF
 3. INSTRUCTION
 4. Key CONCENTRATION (LOW) CR/LF
 5. INSTRUCTION
 6. Key CONCENTRATION (HIGH) CR/LF
 7. INSTRUCTION
 8. Key PERCENTAGE (LOW) CR/LF
 9. INSTRUCTION
 10. Key PERCENTAGE (HIGH) CR/LF
 11. INSTRUCTION
 12. Key PERCENTAGE (UNKNOWN)
CR/LF
 13. Read:
